

## Dd-wrt Super Channel Activation

The screenshot shows the DD-WRT web interface. At the top, there's a navigation menu with tabs for Setup, Wireless, Services, Security, Access Restrictions, NAT / QoS, Administration, and Status. The main content area is divided into two sections: WAN Setup and Network Setup. The WAN Setup section includes fields for WAN Connection Type (set to Automatic Configuration - DHCP), STP (Enable/Disable), Router Name (DD-WRT), Host Name, Domain Name, and MTU (Auto). The Network Setup section includes fields for Router IP, Local IP Address (192.168.1.1), Subnet Mask (255.255.255.0), and Gateway (0.0.0.0). A Help sidebar on the right provides instructions for each field.

Re: "Intellectual property is an issue that the US government has been fighting against since the days of Napoleon. The reason why, in most developed nations, is because it is a poor policy. Copyright is there to protect the author from being exploited by others, and to reward them with a cut of the profit. Intellectual property like patents and trademarks is there to protect the purchaser from being exploited by others. The USA is unique in that it is one of the last great territories of the Enlightenment to give up these protections, and instead introduced a system of "copy-with-modifications" protection. In a world where most of the "western" powers have had a free market in media products for about 150 years, this is entirely bizarre." I completely agree with this. I hate when one person, or a small group of people, claim ownership over an idea. If it's an idea that doesn't belong to anyone, then I'm not that worried about it. I'm sorry, but it's just a myth that giving your money to the government will improve your life. I'm not a gold-bug, and I don't expect to see gold money anytime soon. What I do see is enough to be concerned. Governments love to use all kinds of fancy sounding terms to justify taking your money. "The FCC has been granted by the US Congress to regulate interstate and international communications by radio. That's why it has been able to ban indecency. The US Constitution grants the FCC broad authority to regulate interstate communications. The FCC also does not need Congressional approval to issue rules for the domestic or international broadcast of programs. All that having been said, the courts are still the appropriate venue to decide if the FCC has overstepped its bounds. The FCC is not granting itself any new authority. It simply recognizes its authority. That's all. Give me a break! FCC has given itself the authority to regulate interstate & international communications by radio, at least according to the Supreme Court in the decision on the last overreach of the FCC. In any event, this was not such a big deal, since we already have the ability to say what content we want to see. If you don't like that you can get your own TV station. It is already a huge problem for cable companies who must handle billing for all channels they broadcast. It's like when the 82157476af
